

Response to a last-minute request

#Challenge

Trescal signed a 5-year contract with a major aeronautic manufacturer. During the first year, Trescal worked on two main areas:

> The establishment of an ISO/IEC 17025 accredited Laboratory for calibrating measuring instruments, plus a team of Engineers to check and maintain Assembly Tools.

> The calibration of Electrical and Dimensional Equipment within a Trescal Laboratory.

As Trescal quickly and efficiently took charge of these areas, the client entrusted the Group with a new project for measuring the wings on their new aircraft using the latest Laser Dimensional Metrology Technology.

#Summary

52% of operations are carried out in less than 

4 hours

Increase from  15 to 43 employees in the last 12 months

Trescal demonstrated its responsiveness and flexibility when faced with technical and personnel related challenges, a tight schedule and a ramp-up. This was overcome by decisively recruiting and training a large number of people within very short timeframes. The contract has thus become a genuine long-term partnership.

#Response provided

Trescal invested heavily and implemented an ambitious program in response to this new request. The main challenge was to swiftly hire and train teams for this new project and to double the workforce on the initial contract.

The Engineers who had been incorporated into the client teams needed to take measurements at each step of the construction. The dedicated teams therefore worked 24 hours a day, six days a week. Trescal thus demonstrated a remarkable ability to adapt to the client's needs and support them in this process.
